

## Microsoft .NET Network Applications

### Custom, web-based access to company data

Deliver timely business results to your customers and key business associates

Leverage the power and flexibility of the Internet, and provide information pro-actively rather than just responding to inquiries.

### Online tracking, data entry, and reporting

Make highly visible information that's locked inside hard-to-reach, separate application programs.

What gets measured gets done, and a secure, online review of key information will turn your data into business action.

## Looking for the "Right fit"?

We can provide a review of prospective network application requirements

## "Right fit" custom business software

### Custom solutions for the right business fit

Make sure your business software fits your business – not the other way around.

"Right fit" business software makes you excel at your core business – rather than excelling at figuring out how to manipulate the business software.

### Integrate, modify existing business software

Make the best use out of existing business software.

In particular, consider fine-tuning requirements with existing business software to prepare for the investment and commitment of a larger custom business software solution.

### Custom networked databases

Organize and streamline the key information in your organization into a single, highly accessible central database.

Pull your key separately-maintained documents and spreadsheet information into a powerful tool that will let you find what you want, when you want it.
